Noble, M., Lewis, S.A. and Cowan, N.J.
The microtubule binding domain of microtubule-associated protein
MAPIB contains a repeated sequence motif unrelated to that of MAP2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RSDVLETVVLINPSDEAVSTEVRLMITDAARHKLLVLTGOCFENTGELILOSGSFSFC

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 24; Page 76; 183pp; Japanese.
This sequence encodes full length osteoclastogenesis inhibitory factor (OCIF) 5. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducting conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.

Claim 72; Page -; 183pp; Japanese.

Costeoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CCR4 in which amino acids 123·380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under reducing conditions. The protein is adsorbed onto cation-exchangers non-reducing conditions. The protein is adsorbed onto cation-exchangers or hepstrin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis. This sequence is not given in the specification and is derived from the protein sequence and the wild type OCIF CDNA sequence given in T36685.

for bone resorption control, sep. treatment of osteporosis

Claim 84; Page 149-150; 183pp; Japanese.

This sequence encodes a mutated version of the full length
osteoclastogenesis inhibitory factor (OCIF) of the invention. This
sequence encodes OCIF-CBsp in which amino acids 167-380 of the mature
protein have been deleted. These amino acid changes have been caused
by the introduction of a restriction site. The OCIF of the invention
has a molecular weight by SDS-PAGE of 60 kD under reducing conditions
and 120 kD under non-reducing conditions. The protein is adsorbed onto
cation-exchangers or heparin and its activity is lowered after 10 mins
at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90
deg.C. OCIF is useful in the control of bone resorption and therefore

Sequence encodes a mutated version of the full length

osteoclastogenesis inhibitory factor (COIF) of the invention. This sequence encodes OCIF-CDD1 in which amino acids 177-380 of the mature protein have been deleted. The OCIF of the invention and 120 kD under veright by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis. This sequence is not given in the specification and is derived from the
                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim [66, Page 145; 183pp; Japanese.

This Sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CDD2 in which amino acids 252-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kb under reducing conditions and 120 kb under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 70 mins at 56 deg.C. and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                        ö
protein sequence and the wild type OCIF cDNA sequence given in T36685. Sequence 594 BP; 176 A; 152 C; 136 G; 130 T;

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis Claim 81; Page 149; 183pp; Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CSph in which maino acids 298-380 of the mature protein have been deleted and replaced by Ser-Leu-Asp. These amino acid changes have been caused by the introduction of a restriction site. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis for bone resorption control, esp. treatment of osteoporosis claim 5½, Page 141-142; 183pp; Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-DDDI in which amino acids 178-252 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C or CIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                           ô

To the product of the control, esp. treatment of osteoporosis claim 57; Page 142-143; 183pp; Japanese.

To bone resorption control, esp. treatment of osteoporosis claim 57; Page 142-143; 183pp; Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes of CIF-DDD2 in which amino acids 253-326 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under reducing conditions and 120 kD under on reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

Claim 78; Page 148; 183pp; Japanese.

Claim 78; Page 148; 183pp; Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CBst in which Gla371 is substituted with Leu and amino acids 373-380 of the mature protein have been deleted. These anion acid changes have been caused by the introduction of a restriction site. The OCIF of the invention has a molecular weight by SDS-PAGE of the invention has a molecular weight by SDS-PAGE of the invention has a molecular weight by SDS-PAGE of conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

DNA encoding osteoclastogenesis inhibitory factor protein - useful for bone resorption control, esp. treatment of osteoporosis claim 60; Page 143-144; 183pp; Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CL in which amino acids 379-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

Page 135-135; 183pp; Japanese.

This sequence encodes a mutade version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes to which the 22nd Cys residue in the mature oCIF protein is substituted by Ser. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation—exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 70 deg.C. OCIF is useful in the control of bone resorption and therefore in the control of bone resorption of circum the control of bone resorption.

Mean 10.031; Variance 1.782; scale 5.629 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aexial tissue (stems, flowers and siliques. The vector is BRL's lambda 2ip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dr

/note="Organ: eye; Vector: lambda gt10; Site_1: EcoRI; Site_2: EcoRI; The library used for sequencing was a sublibrary derived from a human retina cDNA library. Inserts from retina cDNA library DNA were isolated, randomly primed, PCR amplified, size-selected, and cloned into lambda gt10. Individual plaques were arrayed and used as templates for PCR amplification, and these PCR

                                                                                                                                                                                                                                                                                                   Note="Vector: ZipLox; Site_1: Sall; Site_2: NotI; ds-cDNA was prepared from oligo-dr selected mRNA by priming with a NotI oligo-dr oligomer and then adding the second strand to RNase-nicked DNA:RNA hybrid with DNA Poll. Sall adaptors were added to the ends, the ds-cDNAs were then dispested with NotI and size-selected. These were directionally-cloned into the ZipLox phage vector, excised as plasmids, and then individually analyzed."

/note="Organ: mixed (see below); Vector: pT7T3D-Pac
(Pharmacia) with a modified polylinker; Site_1: Not I;
Site_2: Eco RI; Equal amounts of plasmid DNA from three
normalized libraries (melanocyte 2NbHz, pregnant uterus
NbH9U, and fetal heart NbHH19W) were mixed and ss circles
were made in vitro. Following HAP purification, this DNA
was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified cDNAs from pools of
5,000 clones made from the same 3 libraries. The pools
consisted of I.M.A.G.E. clones 260232-265223,
340488-348479, and 484488-489479."
